

Personal SWOT analysis

1. Strengths

I have solid knowledge in information security area, particularly cryptographic algorithms and protocols, network security, security of wireless systems. I'm also experienced in networking including routing protocols and equipment. Furthermore, programming skills are present (probably the skills in C and Matlab can be considered as more advanced), although I must admit that programming is not my best part.

Beside technical skills, I believe I have good communication and presentation skills. Moreover, I am not afraid of taking high responsibilities.

2. Weaknesses

I do not know what to write in this section.

3. Opportunities

It would be interesting to get involved into large-scale projects. Naturally, area of security and developing secure platforms would be preferable, however other opportunities might be useful for me as well. As a future option, I see myself as a system architect, especially for security systems. Therefore, it could be interesting to deal with something close in this course.

4. Threats

I would not like to get involved into projects which turn around only one specific task like developing a mobile application.
